Environmental sustainability is a step towards reducing our global impact on the planet, however, it has to integrate both social and economic factors. According to the Financial Times lexicon, environmental sustainability refers to a state in which the demands placed on the environment can be met without reducing its capacity to allow all people to live well, now and in the future. Due to a large body of evidence pointing to real changes in the Earth’s resources, environmental sustainability looks at ways to reduce the harvesting of non-renewable resources, as well as the effects the activities associated with them have on the Earth’s biosphere. In other words, environmental sustainability tries to avoid the depletion of non-renewable resources. Environmental issues are harmful effects of human activity on the biophysical environment. Environmental protection is a practice of protecting the natural environment on the individual, organizational or governmental levels, for the benefit of both the environment and humans. Environmentalism, a social and environmental movement, addresses environmental issues through advocacy, education and activism.
