Academic publishing is the subfield of publishing which distributes academic research and scholarship. Most academic work is published in academic journal article, book or thesis form. The part of academic written output that is not formally published but merely printed up or posted on the Internet is often called “grey literature”. Most scientific and scholarly journals, and many academic and scholarly books, though not all, are based on some form of peer review or editorial refereeing to qualify. Finally, one of the best books on operating systems I have ever read is UNIX Systems for Modern Architectures (1994) by Schimmel. It discusses how an operating system supports SMP, caches, and so on.
